Amendments to the Claims:

Claim 1 (Original)

A shell type needle roller bearing wherein a plurality of needle rollers are arranged along the inner-diameter surface of a shell type outer ring formed by pressing, characterized in that the surface roughness of the inner-diameter surface of said outer ring is finer than the surface roughness of its outer-diameter surface.

Claim 2 (Original)

A shell type needle roller bearing as claimed in claim 1 wherein the circumferential surface roughness of the inner-diameter surface of said outer ring is Ra 0.05- $0.3 \mu m$.

Claim 3 (Original)

A shell type needle roller bearing as claimed in claim 2 wherein the axial surface roughness of the inner-diameter surface of said outer ring is Ra $0.3\mu m$ or less.

Claim 4 (Original)

A shell type needle roller bearing wherein a plurality of needle rollers are arranged along the inner-diameter surface of a shell type outer ring formed by pressing, characterized in that the inner-diameter roundness of said outer ring is not more than $10 \mu m$.

Claim 5 (Original)

A shell type needle roller bearing wherein a plurality of needle rollers are arranged along the inner-diameter surface of a shell type outer ring formed by pressing, characterized in that the amount of uneven thickness of the tubular portion of said outer ring is less than $10 \, \mu m$.

Claim 6 (Currently amended)

A shell type needle roller bearing as claimed in any of claims 1-5 claim 1 wherein means for making the surface roughness of the inner-diameter surface of said outer ring finer than the surface roughness of its outer-diameter surface, means for making the inner-diameter roundness of said outer ring less than 10 μ m, or means for making the amount of uneven thickness of the tubular portion of said outer ring less than 10 μ m is one in which an ironing step is provided in the pressing for forming said shell type outer ring, and the lubricating conditions on the outer-diameter side ironing surface which is the outer-diameter surface of said outer ring in the ironing step are a substantially fluid lubricating state.

Claim 7 (Original)

A shell type needle roller bearing as claimed in claim 6 wherein the number of drawings in a drawing step in said pressing is not more than three times, and said drawing step is a drawing/ironing step carried out simultaneously with said drawing step, which is final.

Claim 8 (Original)

A shell type needle roller bearing as claimed in claim 7 wherein the number of drawings in said drawing step is one, and said ironing step is a drawing/ironing step carried out simultaneously with this one-time drawing step.

Claim 9 (Currently amended)

A shell type needle roller bearing as claimed in any of claims 6-9 claim 6 wherein the material of said shell type outer ring is a phosphate film-treated steel plate.

Claim 10 (Currently amended)

A support structure for a spindle of a compressor in which a compression action member of the compressor is actuated by rotary-driving the spindle, and radial loads on the spindle are supported by a needle roller bearing arranged in the compressor, characterized in that said needle roller bearing is a shell type needle roller bearing as claimed in any of claims 2-9 claim 2.

Claims 11 (Currently amended)

A support structure for a piston pump driving portion wherein the driving portion of the piston pump is abutment-supported by a needle roller bearing fitted on an eccentric portion of a motor output shaft, characterized in that said needle roller bearing is a shell type needle roller bearing as claimed in any of claims 2-9 claim 2.

Claim 12 (New)

A shell type needle roller bearing as claimed in claim 4 wherein means for making the surface roughness of the inner-diameter surface of said outer ring finer than the surface roughness of its outer-diameter surface, means for making the inner-diameter roundness of said outer ring less than 10 μ m, or means for making the amount of uneven thickness of the tubular portion of said outer ring less than 10 μ m is one in which an ironing step is provided in the pressing for forming said shell type outer ring, and the lubricating conditions on the outer-diameter side ironing surface which is the outer-diameter surface of said outer ring in the ironing step are a substantially fluid lubricating state.

Claim 13 (New)

A shell type needle roller bearing as claimed in claim 5 wherein means for making the surface roughness of the inner-diameter surface of said outer ring finer than the surface roughness of its outer-diameter surface, means for making the inner-diameter roundness of said outer ring less than 10 μ m, or means for making the amount of uneven thickness of the tubular portion of said outer ring less than 10 μ m is one in which an ironing step is provided in the pressing for forming said shell type outer ring, and the lubricating conditions on the outer-

diameter side ironing surface which is the outer-diameter surface of said outer ring in the ironing step are a substantially fluid lubricating state.

Claim 14 (New)

A support structure for a spindle of a compressor in which a compression action member of the compressor is actuated by rotary-driving the spindle, and radial loads on the spindle are supported by a needle roller bearing arranged in the compressor, characterized in that said needle roller bearing is a shell type needle roller bearing as claimed in claim 4.

Claim 15 (New)

A support structure for a spindle of a compressor in which a compression action member of the compressor is actuated by rotary-driving the spindle, and radial loads on the spindle are supported by a needle roller bearing arranged in the compressor, characterized in that said needle roller bearing is a shell type needle roller bearing as claimed in claim 5.

Claims 16 (New)

A support structure for a piston pump driving portion wherein the driving portion of the piston pump is abutment-supported by a needle roller bearing fitted on an eccentric portion of a motor output shaft, characterized in that said needle roller bearing is a shell type needle roller bearing as claimed in claim 4.

Claims 17 (New)

A support structure for a piston pump driving portion wherein the driving portion of the piston pump is abutment-supported by a needle roller bearing fitted on an eccentric portion of a motor output shaft, characterized in that said needle roller bearing is a shell type needle roller bearing as claimed in claim 5.
